

MAP IMAGE DISPLAY DEVICE

ABSTRACT OF THE DISCLOSURE

A map image display device is configured and arranged to improve operability by enabling a map image of a location distant from a currently displayed map image to be
5 appropriately displayed with a simple operation. The map image display device displays names that are subject to a user's input command superimposed on a map image, and, if one of the displayed names is specified, switches the map image to be displayed to a map image in the vicinity of the specified name. At this time, the map image display device selects as the name to be superimposed on the map image at least one distant map name
10 that is not included in the map image to be displayed, and displays that selected distant map name superimposed in the map image peripheral part corresponding to the bearing from the center of the map image to be displayed.
